

The Hub Dental Practice

Looking Nicer By Jonnie

Introduction

We are seeing a larger number of patients with severe mottling of the teeth, often there since eruption, and sometimes after Orthodontic Treatment and often for no apparent reason.

Before and After

We use Icon Caries Infiltrant smooth surface.

- Gentle method for counteracting cariogenic white spots – with an esthetic side effect
- No unnecessary loss of healthy hard tissue
- User-friendly and patient-friendly application process in only one sitting
- No need for drilling or Injections

How It Works

Icon (DMG), caries Infiltration CONcept, is a product used to arrest further demineralization of lesions.

In a nutshell, the procedure involves the use of an HCl etchant to erode the surface of the lesion for the purpose of exposing the lesion porosities.

This step is followed by drying and infiltration of an incipient lesion with an unfilled low viscosity light cured resin material.

This micro-invasive treatment method creates a diffusion barrier not only on the surface but within the hard tissue thus stabilizing and arresting the caries progression.
